Preface	ii
I PART I - Introductory Course	1
1 Dynamic Phenomena in Cells	3
1.1 Scope of Cellular Dynamics	3
1.2 Computational Modeling in Biology	7
1.2.1 Cartoons, Mechanisms, and Models	8
1.2.2 The Role of Computation	9
1.2.3 The Role of Mathematics	10
1.3 A Simple Molecular Switch	11
1.4 Solving and Analyzing Differential Equations	13
1.4.1 Numerical Integration of Differential Equations	15
1.4.2 Introduction to Numerical Packages	18
2 Voltage Gated Ionic Currents	21
2.1 Basis of the Ionic Battery	23
2.1.1 The Nernst Potential: Charge Balances Concentration	24
2.1.2 The Resting Membrane Potential	25
2.2 The Membrane Model	26
2.2.1 Equations for Membrane Electrical Behavior	27
2.3 Activation and Inactivation Gates	29
2.3.1 Models of Voltage-Dependent Gating	29
2.3.2 The Voltage Clamp	31

2.4	Interacting Ion Channels: The Morris–Lecar Model	34
2.4.1	Phase Plane Analysis	37
2.4.2	Stability Analysis	38
2.4.3	Why Do Oscillations Occur?	40
2.4.4	Excitability and Action Potentials	43
2.4.5	Type I and Type II Spiking	44
2.5	The Hodgkin–Huxley Model	45
2.6	FitzHugh–Nagumo Class Models	48
2.7	Summary	49
3	Transporters and Pumps	53
3.1	Passive Transport	54
3.2	Transporter Rates	57
3.2.1	Algebraic Method	59
3.2.2	Diagrammatic Method	60
3.2.3	Rate of the GLUT Transporter	62
3.3	The Na ⁺ /Glucose Cotransporter	65
3.4	SERCA Pumps	70
3.5	Transport Cycles	73
4	Reduction of Scale	77
4.1	The Rapid Equilibrium Approximation	78
4.2	Time–Scale Analysis	82
4.3	Glucose–Dependent Insulin Secretion	83
4.4	Ligand Gated Channels	88
4.5	The Neuromuscular Junction	90
4.6	The Inositol Trisphosphate (IP ₃) receptor	91
4.7	Michaelis–Menten Kinetics	94
5	Whole–Cell Models	101
5.1	Models of ER and PM Calcium Handling	102
5.1.1	Flux Balance Equations with Rapid Buffering	103
5.1.2	Expressions for the Fluxes	106
5.2	Calcium Oscillations in the Bullfrog Sympathetic Ganglion Neuron	108
5.2.1	Ryanodine Receptor Kinetics: The Keizer–Levine Model	109
5.2.2	Bullfrog Sympathetic Ganglion Neuron Closed–Cell Model	111
5.2.3	Bullfrog Sympathetic Ganglion Neuron Open–Cell Model	112
5.3	The Pituitary Gonadotroph	115
5.3.1	The ER Oscillator in a Closed Cell	116
5.3.2	Open–Cell Model with Constant Calcium Influx	122
5.3.3	The Plasma Membrane Oscillator	124
5.3.4	Bursting Driven by the ER in the Full Model	126
5.4	The Pancreatic Beta Cell	128

5.4.1	Chay–Keizer Model	130
5.4.2	Chay–Keizer with an ER	133
6	Intercellular Communication	140
6.1	Electrical Coupling and Gap Junctions	142
6.1.1	Synchronization of Two Oscillators	142
6.1.2	Asynchrony Between Oscillators	143
6.1.3	Cell Ensembles, Electrical Coupling Length Scale	144
6.2	Synaptic Transmission Between Neurons	146
6.2.1	Kinetics of Postsynaptic Current	147
6.2.2	Synapses: Excitatory and Inhibitory; Fast and Slow	148
6.3	When Synapses Might (or Might Not) Synchronize Active Cells	150
6.4	Neural Circuits as Computational Devices	154
6.5	Large–Scale Networks	159
II	PART II - Advanced Material	169
7	Spatial Modeling	171
7.1	One-Dimensional Formulation	173
7.1.1	Conservation in One Dimension	173
7.1.2	Fick’s Law of Diffusion	175
7.1.3	Advection	176
7.1.4	Flux of Ions in a Field	177
7.1.5	The Cable Equation	177
7.1.6	Boundary and Initial Conditions	178
7.2	Important Examples with Analytic Solutions	179
7.2.1	Diffusion Through a Membrane	179
7.2.2	Ion Flux Through a Channel	180
7.2.3	Voltage Clamping	181
7.2.4	Diffusion in a Long Dendrite	181
7.2.5	Diffusion into a Capillary	183
7.3	Numerical Solution of the Diffusion Equation	184
7.4	Multidimensional Problems	186
7.4.1	Conservation Law in Multiple Dimensions	186
7.4.2	Fick’s Law in Multiple Dimensions	187
7.4.3	Advection in Multiple Dimensions	188
7.4.4	Boundary and Initial Conditions for Multiple Dimensions	188
7.4.5	Diffusion in Multiple Dimensions: Symmetry	188
7.5	Traveling Waves in Nonlinear Reaction–Diffusion Equations	189
7.5.1	Traveling Wave Solutions	190
7.5.2	Traveling Wave in the Fitzhugh–Nagumo Equations	193

8	Modeling Intracellular Calcium Waves and Sparks	198
8.1	Microfluorometric Measurements	198
8.2	A Model of the Fertilization Calcium Wave	200
8.3	Including Calcium Buffers in Spatial Models	202
8.4	The Effective Diffusion Coefficient	203
8.5	Simulation of a Fertilization Calcium Wave	204
8.6	Simulation of a Traveling Front	205
8.7	Calcium Waves in the Immature <i>Xenopus</i> Oocyte	208
8.8	Simulation of a Traveling Pulse	208
8.9	Simulation of a Kinematic Wave	210
8.10	Spark-Mediated Calcium Waves	212
8.11	The Fire–Diffuse–Fire Model	215
8.12	Modeling Localized Calcium Elevations	220
8.13	Steady-State Localized Calcium Elevations	223
	8.13.1 The Steady–State Excess Buffer Approximation (EBA)	224
	8.13.2 The Steady–State Rapid Buffer Approximation (RBA)	225
	8.13.3 Complementarity of the Steady-State EBA and RBA	226
9	Biochemical Oscillations	231
9.1	Biochemical Kinetics and Feedback	233
9.2	Regulatory Enzymes	237
9.3	Two-Component Oscillators Based on Autocatalysis	240
	9.3.1 Substrate–Depletion Oscillator	241
	9.3.2 Activator–Inhibitor Oscillator	243
9.4	Three-Component Networks Without Autocatalysis	244
	9.4.1 Positive Feedback Loop and the Routh–Hurwitz Theorem	245
	9.4.2 Negative Feedback Oscillations	245
	9.4.3 The Goodwin Oscillator	246
9.5	Time-Delayed Negative Feedback	248
	9.5.1 Distributed Time Lag and the Linear Chain Trick	249
	9.5.2 Discrete Time Lag	250
9.6	Circadian Rhythms	251
10	Cell Cycle Controls	263
10.1	Physiology of the Cell Cycle in Eukaryotes	263
10.2	Molecular Mechanisms of Cell Cycle Control	265
10.3	A Toy Model of Start and Finish	267
	10.3.1 Hysteresis in the Interactions Between Cdk and APC	268
	10.3.2 Activation of the APC at Anaphase	270
10.4	A Serious Model of the Budding Yeast Cell Cycle	271
10.5	Cell Cycle Controls in Fission Yeast	274
10.6	Checkpoints and Surveillance Mechanisms	277
10.7	Division Controls in Egg Cells	279

10.8	Growth and Division Controls in Metazoans	280
10.9	Spontaneous Limit Cycle or Hysteresis Loop?	282
11	Modeling the Stochastic Gating of Ion Channels	289
11.1	Single-Channel Gating and a Two-State Model	289
11.1.1	Modeling Channel Gating as a Markov Process	290
11.1.2	The Transition Probability Matrix	292
11.1.3	Dwell Times	293
11.1.4	Monte Carlo Simulation	294
11.1.5	Simulating Multiple Independent Channels	295
11.1.6	Gillespie's Method	296
11.2	An Ensemble of Two-State Ion Channels	297
11.2.1	Probability of Finding N Channels in the Open State	297
11.2.2	The Average Number of Open Channels	300
11.2.3	The Variance of the Number of Open Channels	301
11.3	Fluctuations in Macroscopic Currents	302
11.4	Modeling Fluctuations in Macroscopic Currents with Stochastic ODEs	306
11.4.1	Langevin Equation for an Ensemble of Two-State Channels	308
11.4.2	Fokker-Planck Equation for an Ensemble of Two-State Channels	309
11.5	Membrane Voltage Fluctuations	312
11.5.1	Membrane Voltage Fluctuations with an Ensemble of Two-State Channels	314
11.6	Stochasticity and Discreteness in an Excitable Membrane Model	315
11.6.1	Phenomena Induced by Stochasticity and Discreteness	317
11.6.2	The Ensemble Density Approach Applied to the Stochastic Morris-Lecar Model	318
11.6.3	Langevin Formulation for the Stochastic Morris-Lecar Model	320
12	Molecular Motors: Theory	324
12.1	Molecular Motions as Stochastic Processes	327
12.1.1	Protein Motion as a Simple Random Walk	327
12.1.2	Polymer Growth	329
12.1.3	Sample Paths of the Process	331
12.1.4	The Statistical Behavior of Polymer Growth	333
12.2	Modeling Molecular Motions	334
12.2.1	The Langevin Equation	334
12.2.2	Numerical Simulation of the Langevin Equation	336
12.2.3	The Smoluchowski Model	337
12.2.4	First Passage Time	338
12.3	Modeling Chemical Reactions	339
12.4	A Mechanochemical Model	342

12.5	Numerical Simulation of Protein Motion	343
12.5.1	Numerical Algorithm that Preserves Detailed Balance	344
12.5.2	Boundary Conditions	345
12.5.3	Numerical Stability	347
12.5.4	Implicit Discretization	348
12.6	Derivations and Comments	349
12.6.1	The Drag Coefficient	349
12.6.2	The Equipartition Theorem	349
12.6.3	A Numerical Method for the Langevin Equation	350
12.6.4	Some Connections with Thermodynamics	351
12.6.5	Jumping Beans and Entropy	353
12.6.6	Jump Rates	354
12.6.7	Jump Rates at an Absorbing Boundary	355
13	Molecular Motors: Examples	359
13.1	Switching in the Bacterial Flagellar Motor	359
13.2	A Motor Driven by a “Flashing Potential”	364
13.3	The Polymerization Ratchet	367
13.4	Model of a Simple Molecular Motor	369
13.4.1	The Average Velocity of the Motor in the Limit of Fast Diffusion	371
13.4.2	Brownian Ratchet vs. Power Stroke	374
13.4.3	The Average Velocity of the Motor When Chemical Reactions Are as Fast as Diffusion	375
13.5	Other Motor Proteins	378
A	Qualitative Analysis of Differential Equations	384
A.1	Matrix and Vector Manipulation	385
A.2	A Brief Review of Power Series	386
A.3	Linear ODEs	388
A.3.1	Solution of Systems of Linear ODEs	389
A.3.2	Numerical Solutions of ODEs	392
A.3.3	Eigenvalues and Eigenvectors	392
A.4	Phase Plane Analysis	394
A.4.1	Stability of Steady States	396
A.4.2	Stability of a Nonlinear Steady State	398
A.5	Bifurcation Theory	401
A.5.1	Bifurcation at a Zero Eigenvalue	402
A.5.2	Bifurcation at a Pair of Imaginary Eigenvalues	405
A.6	Perturbation Theory	407
A.6.1	Regular Perturbation	407
A.6.2	Resonances	409
A.6.3	Singular Perturbation Theory	411

B Solving and Analyzing Dynamical Systems Using XPPAUT	416
B.1 Basics of Solving Ordinary Differential Equations	417
B.1.1 Creating the ODE File	417
B.1.2 Running the Program	418
B.1.3 The Main Window	419
B.1.4 Solving the Equations, Graphing, and Plotting.	420
B.1.5 Saving and Printing Plots	422
B.1.6 Changing Parameters and Initial Data	424
B.1.7 Looking at the Numbers: The Data Viewer	425
B.1.8 Saving and Restoring the State of Simulations	426
B.1.9 Important Numerical Parameters	427
B.1.10 Command Summary: The Basics	428
B.2 Phase Planes and Nonlinear Equations	428
B.2.1 Direction Fields	429
B.2.2 Nullclines and Fixed Points	429
B.2.3 Command Summary: Phase Planes and Fixed Points	432
B.3 Bifurcation and Continuation	433
B.3.1 General Steps for Bifurcation Analysis	433
B.3.2 Hopf Bifurcation in the FitzHugh–Nagumo Equations	434
B.3.3 Hints for Computing Complete Bifurcation Diagrams	436
B.4 Partial Differential Equations: The Method of Lines	437
B.5 Stochastic Equations	440
B.5.1 A Simple Brownian Ratchet	440
B.5.2 A Sodium Channel Model	440
B.5.3 A Flashing Ratchet	442
C Numerical Algorithms	445
References	457
Index	469
